

Peer Review

Ashish's Approach:

- It is also good to see that comments are included to provide additional context on the code. However, there are a few suggestions for improvement:
- It would be helpful to see some error handling mechanisms in place, such as checks to ensure that objects being created do not already exist or catching errors that may occur during the copy process.
- The code could benefit from more descriptive and specific naming conventions for objects being created, such as adding a prefix to table names to identify the purpose of the table.
- It would be beneficial to include a final script to clean up any objects created during the execution of the script.

Shishir Singh's Approach:

- Can use named stages instead of creating stages to directly access the files uploaded from the local storage(@% to directly access the file in the named stage)
- Comments explain the code better at each step.
- It would be beneficial to include a final script to clean up any objects created during the execution of the script.
- The code could benefit from more descriptive and specific naming conventions for objects being created, such as adding a prefix to table names to identify the purpose of the table.
